EDUCATION

2022 - Present

MYANMAR INSTITUTE OF
INFORMATION TECHNOLOGY (MIIT)

- BE (Hons) Computer Science & Engineering (CSE)

2025 - Present

CERTIFICATIONS

- Data Engineering (Level 1)
- Data Engineering (Level 2)
- Python & Django

SKILLS

- Python
- SQL
- MSSQL
- Oracle
- Django
- Effective Communication
- Critical Thinking

PROFILE

Motivated and detail-oriented Junior Database Administrator with basic knowledge of SQL, database management, MySQL, and PostgreSQL. Familiar with database design, writing SQL queries, data organization, backup concepts, and basic troubleshooting. A quick learner with good analytical and problem-solving skills, seeking an entry-level opportunity to gain practical experience and develop strong skills in database administration and IT operations.

PROJECTS

Health Record Management System (HRMS)

- Developed a web-based health record management system using Python and Django to manage patient information, appointments, medical records and prescriptions.
- Implemented CRUD operations, user authentication, and role-based access control for administrators, doctors, and patients.
- Designed relational database models using Django ORM and integrated PostgreSQL for efficient data management.
- Built backend APIs and implemented secure data validation and access controls for sensitive health information.

MiitVerse: A Cloud-Based Smart Social Network for Campus Communication

- MiitVerse is a currently developing cloud-based social media platform built using React, Node.js, and Neo4j. It uses a graph database to efficiently manage relationships between users, posts, comments, likes, follows, and interests. The platform provides features such as user registration, email verification, secure login, profile management, posting, commenting, liking, following, and personalized news feeds.
- By using Neo4j, MiitVerse supports advanced features including friend recommendations, interest-based content suggestions, community discovery, and social network analysis. It is deployed on serverless cloud infrastructure, providing scalability, availability, and reduced server management. Overall, the project demonstrates how graph databases and cloud technologies can be used to build scalable and relationship-focused social networking applications.
